

REFERENZ – drinking water

Chamber of Agriculture, 3100 St. Pölten, Austria

Products: CLASSIC 5/4"

„Since moving in the new building, the water has been softened by an ion exchanger system. This often led to an unpleasant aftertaste (salty taste) of the drinking water.

Due to positive experiences of the house technician with natural water treatment, especially with limescale deposits, an EWO device was also envisaged for the Chamber of Agriculture.

In the summer of 2003, an EWO CLASSIC 5/4 inch was installed in the main line and the existing water softening system dismantled.

The employees were the first to notice the improved water quality. In the past drinking water was rather unpopular as a thirst quencher.

Since the installation of the EWO device, this water is drunken to a higher amount. It tastes good and fresh, so the consistent statement of the employees.

In the beginning, the protection of the installation and the technology from calcification was the reason for the softening of the water. After installation of the EWO device it became apparent that protection is optimally ensured even with EWO.

Since then it has been possible to save 6 x 100-150 kg of salt a year and the associated workload. Up to now, no maintenance of the EWO device was necessary and operation is trouble-free.

The staff and the building services are very satisfied with the decision for natural water treatment.

Besides, I've also been using an EWO device privately for many years and am still very happy with the effect to this day."
